Dear graduate students, we hope this email finds you safe and doing well! The past few
weeks have been trying for our entire Engineering family. I miss seeing your faces in the halls and in my office. It is important we all continue supporting one another as individuals and as a community of scholars during these stressful times. **Please join Dean Gibson and the Research & Graduate Studies team on Monday, 4/6, at 5:30PM via Zoom for a Grad Student Town Hall.** We would like to address your concerns and answer questions from both the college and department levels. The meeting will start with a general session for all grad students, followed by department breakout sessions with chairs, grad directors and grad support staff. Please let us know if you plan to attend! Questions may also be submitted in advance. [RSVP here.](#)

**Superfluids may merge via corkscrew mechanism**

Scientists at the Florida State University-headquartered National High Magnetic Field Laboratory have made a discovery in fluid dynamics that is truly worth uncorking a bottle of fine wine.

**Wei Guo**, an associate professor of mechanical engineering at the FAMU-FSU College of Engineering, and MagLab graduate research assistant Toshiaki Kanai published a new study in the journal Physical Review Letters that sheds light on how quantum fluids – also called superfluids – merge. It turns out they use a corkscrew mechanism. [Read story here.](#)

BEING HUMAN

10 ways to spot online misinformation

Propagandists are already working to sow disinformation and social discord in the run-up to the November elections.

Many of their efforts have focused on social media, where people’s limited attention spans push them to share items before even reading them – in part because people react emotionally, not logically, to information they come across. That’s especially true when the topic confirms what a person already believes.
